Memorial Profanity Filter and Sentiment Analysis

REST API

REST API endpoints details. Main endpoints:

- /analyze?text=<text>

Requirements

- Tested with Node 8.4.0

Configurations

The server should be able to run with the default configurations.

Environment Variables

Modify the environment variables, or create a `.env` file in the root folder ([details](#)).

`PORT` (default: 3000) The port to run the API endpoint server.

General Configurations

The `src/config.js` file has general configurations. In most cases the configurations can be altered with environment variables.

Installation and Scripts

Install [Node.js](#), and optionally install [yarn](#).

To install dependencies run `yarn` or `npm install`.

Scripts

For all scripts you can replace `yarn` by `npm` if you do not have yarn installed.

- `yarn start` starts the server.
- `yarn run dev` automatically reloads the server when developing.
- `yarn run build` compiles pre-ES6 JavaScript to the `build` folder to use with a regular node environment.

Project Overview

Run the server then go to http://127.0.0.0:3000 (or configured port). This will show a demo HTML page where you will be able to input text to be analyzed.
